6. Make a class folder

- Create one new folder, and we will store all the files in that folder.

6. Make a new script file

- Command window

`clc` : just clears command window
`clear` : clears your workspace

6. Make a new script file

Class 6

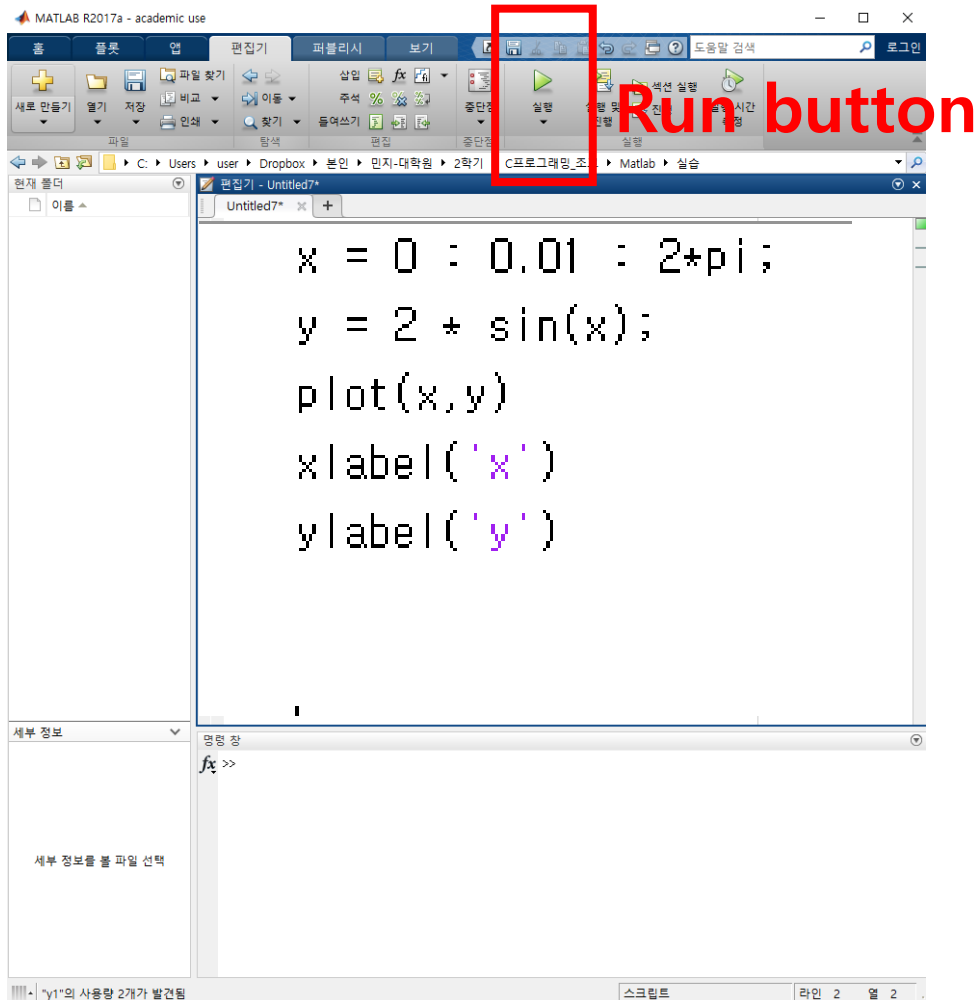

Programming - Matlab

- Make a new script file

6. Make a new script file

- Make a new script file
 - Matlab does not require `#include <stdio.h>`
 - Matlab does not require main function.

Built-in mathematical functions

Function	MATLAB syntax ¹
e^x	<code>exp(x)</code>
\sqrt{x}	<code>sqrt(x)</code>
$\ln x$	<code>log(x)</code>
$\log_{10} x$	<code>log10(x)</code>
$\cos x$	<code>cos(x)</code>
$\sin x$	<code>sin(x)</code>
$\tan x$	<code>tan(x)</code>
$\cos^{-1} x$	<code>acos(x)</code>
$\sin^{-1} x$	<code>asin(x)</code>
$\tan^{-1} x$	<code>atan(x)</code>

`plot(x,y)`

Generates a plot of the array y versus the array x on rectilinear axes.

`title('text')`
`xlabel('text')`
`ylabel('text')`

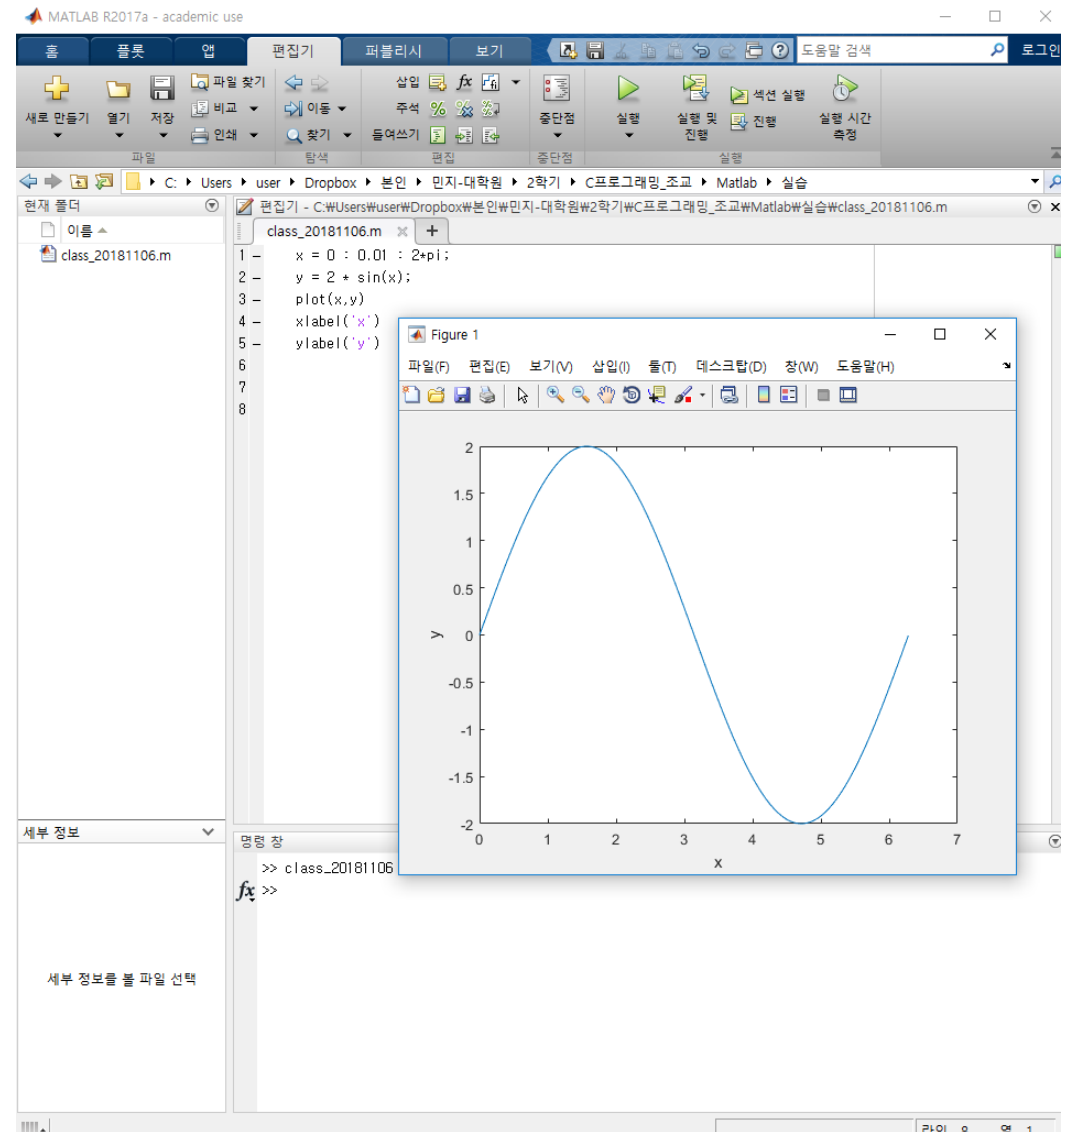

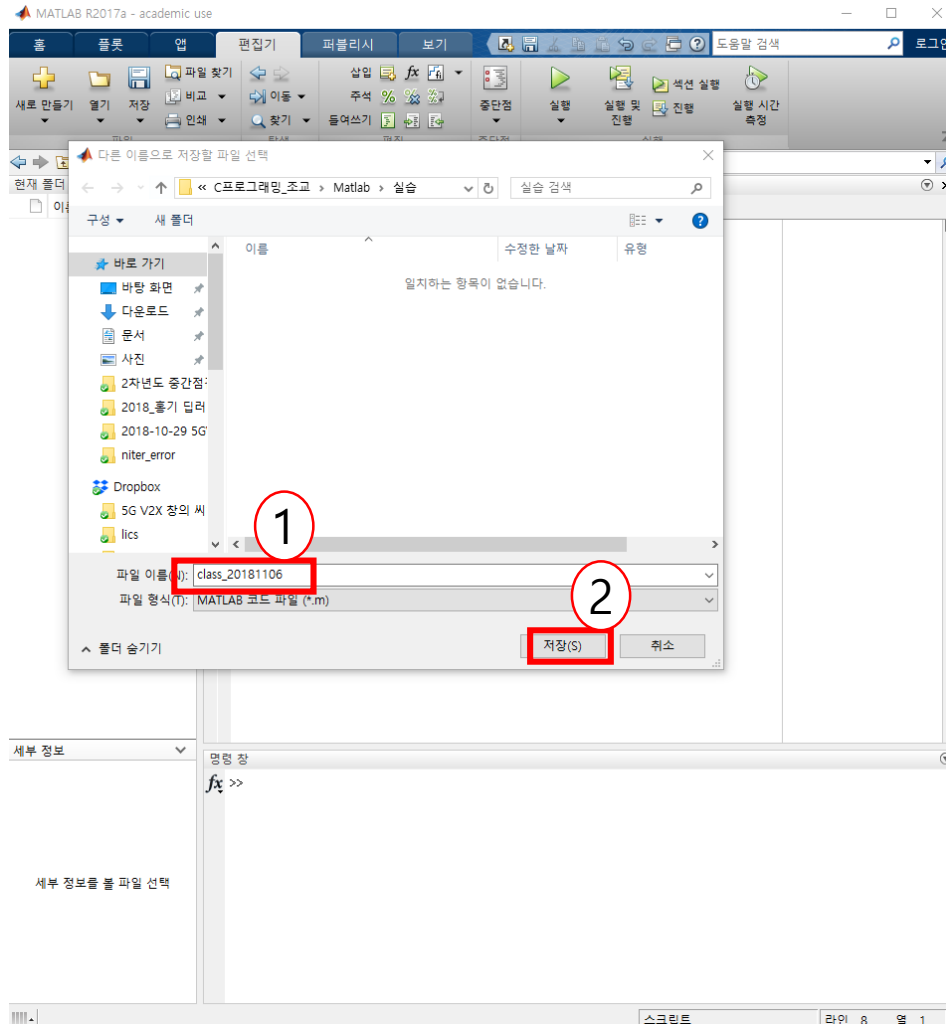

Puts text in a title at the top of the plot.
Adds a text label to the horizontal axis (the abscissa).
Adds a text label to the vertical axis (the ordinate).

6. Using a "plot" command

Class 6

Programming - Matlab

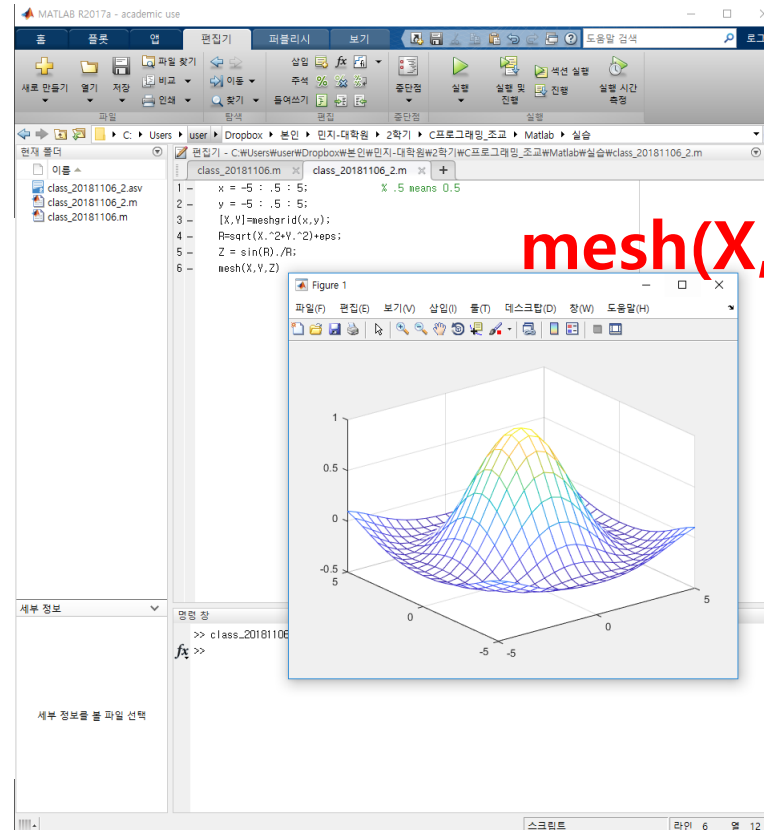

1. Save the script

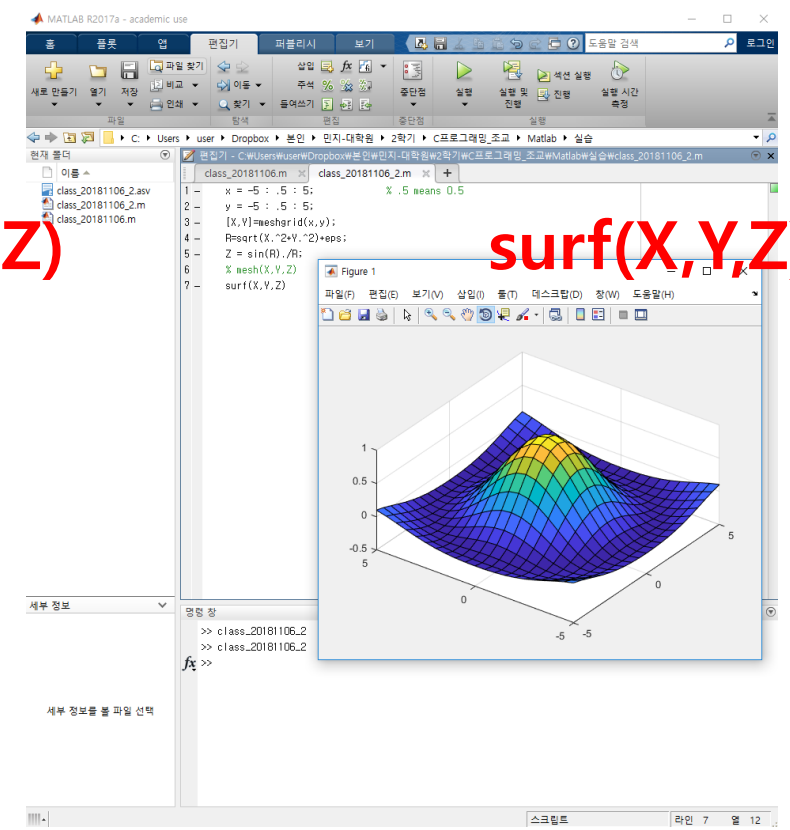

1. Make a new script file

code

```
1 - x = -5 : .5 : 5;
2 - y = -5 : .5 : 5;
3 - [X,Y]=meshgrid(x,y);
4 - R=sqrt(X.^2+Y.^2)+eps;
5 - Z = sin(R)./R;
6 - % mesh(X,Y,Z)
7 - surf(X,Y,Z)
```

mesh(X,Y,Z)

surf(X,Y,Z)

- **Polyval** / poly / roots

Polynomial equation

$$p(x) = x^2 - 4x + 4$$

1

$$p(x) = 4x^5 - 3x^2 + 2x + 33$$

Matlab code

```
p = [1 -4 4];
```

```
p = [4 0 0 -3 2 33];
```

If you want to find the value of Equation1 when $x=2$,

명령 창

```
>> p=[4 0 0 -3 2 33];
```

```
>> polyval(p,2)
```

```
ans =
```

```
153
```

- Polyval / **poly** / **roots**

When you want to create an equation with specific roots, use "**poly**"

```
>> c=poly([-2 -5 -3])
```

```
c =
```

```
1    10    31    30
```

```
>> d=poly([-2,-5])
```

```
d =
```

```
1    7    10
```

When you want to get root when an equation is given, use "**roots**"

```
>> r = roots([2 14 20])
```

```
r =
```

```
-5
```

```
-2
```

• Linear Algebraic Equations

1. Make a new script file
2. The equations are

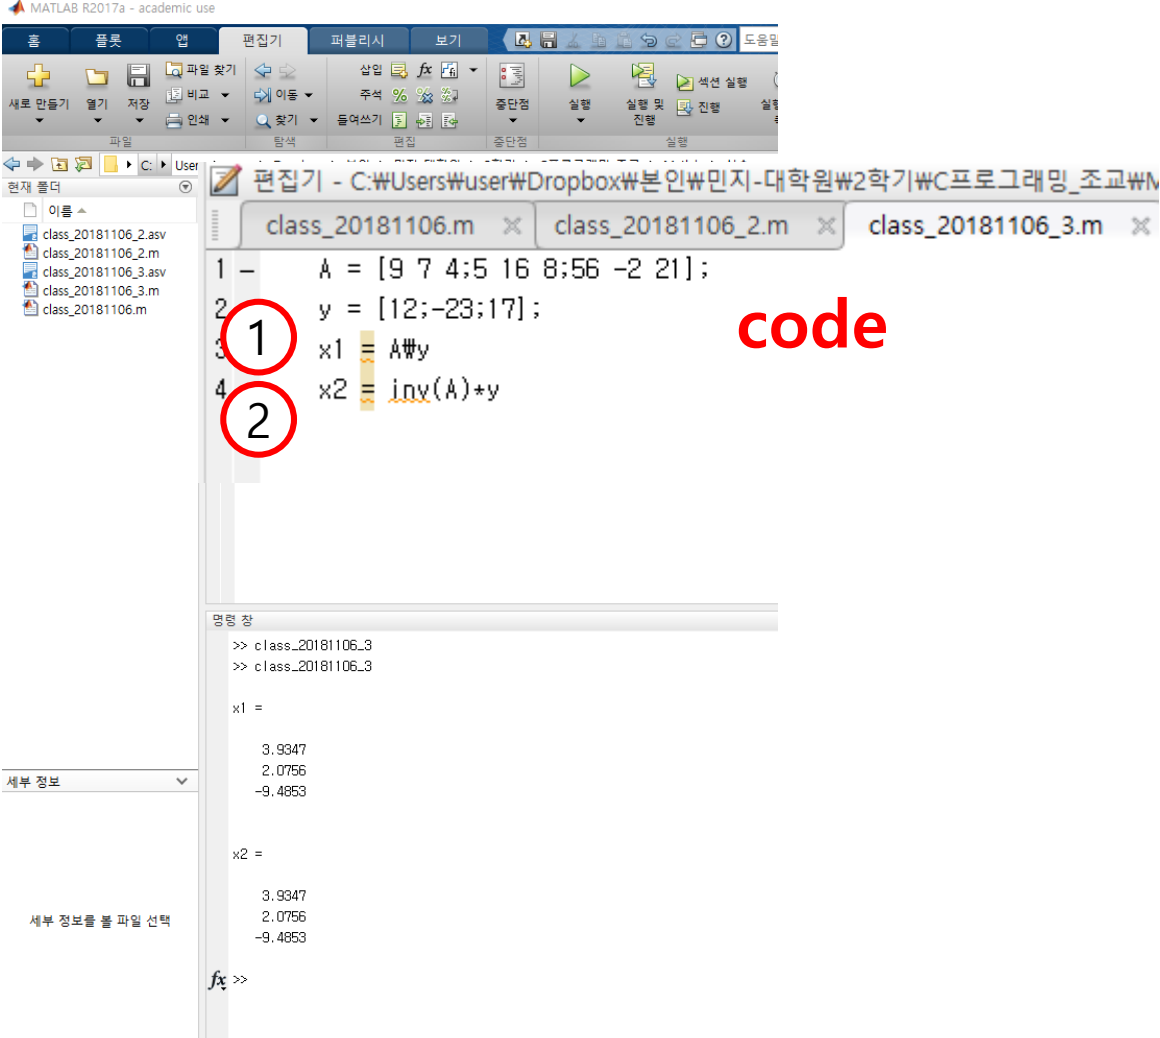

$$9x + 7y + 4z = 12$$

$$5x + 16y + 8z = -23$$

$$56x - 2y + 21z = 17$$

3. The above equation can be expressed in the form of a matrix as follows

$$A = \begin{bmatrix} 9 & 7 & 4 \\ 5 & 16 & 8 \\ 56 & -2 & 21 \end{bmatrix}, \quad Y = \begin{bmatrix} 12 \\ -23 \\ 17 \end{bmatrix}$$

The screenshot shows the MATLAB R2017a interface. The script file 'class_20181106.m' contains the following code:

```

1 - A = [9 7 4; 5 16 8; 56 -2 21];
2 y = [12; -23; 17];
3 x1 = A\y;
4 x2 = inv(A)*y;

```

The command window shows the results of the calculations:

```

>> class_20181106_3
>> class_20181106_3

x1 =

    3.9347
    2.0756
   -9.4853

x2 =

    3.9347
    2.0756
   -9.4853

```

The word "code" is written in red next to the script file.

- Consider the following arrays

First column

First row

$$A = \begin{bmatrix} 1 & 4 & 2 \\ 2 & 4 & 100 \\ 7 & 9 & 7 \\ 3 & \pi & 42 \end{bmatrix} \quad B = \ln(A)$$

- $A(:, 3)$ denotes all the elements in the third *column* of the matrix A .
- $A(3, :)$ denotes all the elements in the third *row* of A .
- $A(:, 2:5)$ denotes all the elements in the second through fifth columns of A .
- $A(2:3, 1:3)$ denotes all the elements in the second and third rows that are also in the first through third columns.
- $v = A(:)$ creates a vector v consisting of all the columns of A stacked from first to last.
- $A(\text{end}, :)$ denotes the last row in A , and $A(:, \text{end})$ denotes the last column.

- $\max(A)$ returns the largest element in A if A is a vector
- $\text{Size}(A)$ returns a row vector $[m \ n]$ containing the sizes of the $m \times n$ array A .
- $\text{sum}(A)$ sums the elements in each column of the array A and returns a row vector containing the sums

- Select just the second row of B
- Evaluate the sum of the second row of B
- Multiply the second column of B and the first column of A element by element
- Evaluate the maximum value in the vector resulting from element-by-element multiplication of the second column of B with the first column of A .
